Does this option include the extrapolated values before IH data are available for blender, clean up, feeder, mill, and resin? See figure 3. I believe that the Average Across Jobs plot was constructed using the "fitted" line from 1972 to 1994 for all job tasks. The JEM would include the 2X correction for 1967 - 1971 for all non-track jobs and use the 1994 value for 1995 -2000. Correct?

Do we have a solid rationale for using a common b?
